The Post 2020 Effort Sharing Decision
The Agriculture Sector

David Baldock, IEEP
European Parliament Workshop
June 1st 2016
Agricultural Sector (ESD)

- ESD focus on non-CO2 emissions (methane, nitrous oxide)
- CO2 emissions/removals are in LULUCF
- Historically, progress has been made mainly through lower livestock numbers
- But a wide range of other technical options to reduce emissions e.g. in livestock, fertiliser and nutrient management
- Greater use of nitrification inhibitors is one example
- Varying rates of return and incentive requirements
- Demand side options also worthwhile but complementary rather than a substitute
Next Steps...

• Clearer roadmap for agricultural emissions within ESD to 2030/2050
• Greater ambition is possible despite challenges
• Stronger database to select, pursue and communicate best options and strengthen policy
• LULUCF regime which delivers reduced emissions
• Merits of a stand alone LULUCF pillar with certain trading provisions
• Stronger climate dimension in the CAP
And your thoughts?

IEEP is an independent, not for profit institute dedicated to advancing an environmentally sustainable Europe through policy analysis, development and dissemination.
