

Biodiesel production in Spain

Ten years of RED - Spain biodiesel data

July 2020

1. Biodiesel in Spain has increased in the past decade

Since the Renewable Energy Directive (RED) was adopted in 2009, the consumption of food and feed based biodiesel (based on vegetable oil) has increased dramatically. This is a result of the targets set in the RED, specially the target for renewables in transport (10% by 2020).
